

Struct AI Agent – V1 Engineering Direction

The AI Agent is the core execution engine of Struct.

It is **not** a chatbot and **not** a separate feature.

It is an execution layer that understands the current System and performs work inside Struct.

V1 Responsibilities

1. Build System

Create complete business systems from user requests.

Examples:

- Marketing System
- CRM
- Project Management
- Company Activities

The Agent should be able to generate:

- Tables
 - Columns
 - Views
 - KPIs
 - Outputs
 - Reports
-

2. Organize Data

Convert unstructured information into structured records.

Supported inputs:

- Plain text
- Meeting notes
- Lists
- CSV

- Existing records
-

3. Analyze System

Analyze the active System only.

Examples:

- Missing information
 - Delayed activities
 - Risks
 - Bottlenecks
 - Performance trends
-

4. Generate Report

Generate reports directly from System data.

Examples:

- Executive Report
 - Weekly Report
 - Progress Report
 - Performance Summary
-

5. Improve System

Continuously suggest improvements.

Examples:

- Missing KPIs
 - Better Views
 - Additional Columns
 - Better Outputs
 - Better Structure
-

Agent Workflow

Every request follows the same pipeline.

Understand Intent

Read Current System Context

Plan

Execute

Verify

Return Result

Context

The Agent must always understand:

- Active Workspace
- Active System
- Active Tables
- Current View
- Existing Data
- User Permissions

The Agent should never operate outside the current System context.

Execution

The Agent should execute operations **inside Struct**.

Examples:

- Create System
- Create Table
- Create Columns
- Create Views

- Organize Records
- Generate Reports
- Update Data

The Agent is not a chatbot.

The Agent is an execution engine for Business Systems.
